

Features & Benefits

CONTACT DRIVE WHEEL - Pneumatic tire is spring loaded to provide slip-free drive. Variable speed hydraulic drive also available.

380/90 R46 TIRES - Provide great flotation while being narrow enough to avoid running over any planted rows on 30" or Twin-Row 30".

8" HYDRAULIC FAN - Provides plenty of air to both the seed metering and seed delivery manifolds. Seed metering receives priority to ensure accurate singulation. Priority is controlled through the IntelliAg™ Planter Control System (part of the patented "Split-Air" System).

Compare refill times, row-spacing options, and bulk-fill capacities and you will agree that Yield-Pro® Planters are designed to make you more money and save you more time than any comparable planter on the market. Simply load the onboard 82- or 150-bushel poly hopper or seed directly from the seed company's bulk box and start planting! A 400-gallon starter fertilizer system featuring a ground-driven CDS-John Blue piston pump may be added to planters equipped with a seed company bulk box or 82-bushel hopper.

The patented air manifold delivers seed on demand to the row unit meters without any moving parts, increasing reliability while decreasing maintenance costs and seed damage. On the row

unit, you have the choice of the Air-Pro® Seed Metering System with interchangeable seed plates for all crops, or a mechanical system with Precision Planting Population Max™ Finger Pickups or Singulator-Plus™ Meters to accurately singulate the seed for precise spacing.

A variety of row spacing options are available for our 12- and 16-Row Yield-Pro Planters, which include 15", 20", 30", Twin-Row 30", and Twin-Row 36" (our 16-Row Planter also offers 36") spacings that are harvested with a standard 30" or 36" corn head. Other options include: variable rate hydraulic drive, Keeton Seed Firmers®, Seed-Lok®, 400-gallon starter fertilizer system*, frame- or unit-mounted coulters, and/or row cleaners.
