SCHULTE SFT PRO

drivelines for the professional

**BONDIOLI
& PAVESI**

**New generation of drivelines designed for long life,
reduced maintenance, ease of use, and increased productivity.**

-Standard cross kits are permanently lubricated.

-Special materials and the robustness of the cross kits and yokes help to reduce stresses and contribute to longer life

-All telescoping members and shield bearings require lubrication every 250 hours and use only one grease fitting
-New sliding tube geometry with larger contact surfaces reduce thrust loads when telescoping

-CV cross kits and body require lubrication every 250 hours
-A special system delivers the lubricant to the CV body in specific amounts from an innovative internal reservoir
-The CV body also uses discs combined with O-rings to retain the grease within the central body and limit contamination

Reduces daily maintenance by up to 1/2 hour

This translates up to 1.5 to 3 miles of additional mowing per day depending upon travel speeds or from 30 to 60 miles in 20 days of mowing.
This equates to \$1900 - \$3800 additional revenue using a \$35/acre rate.

This extended 250 hour lubrication schedule ensures more maintenance opportunities and reduces maintenance costs.
