

Heavy-Duty Air

One of the best ways to increase the efficiency of your farming operation is with a Great Plains Air Drill. Because our air drills feature large central fill hoppers, they allow you to plant more acres in a day than a box drill of equal width.

The CTA4000 implement comes equipped with either the standard 00 Series Opener or the 00HD Heavy-Duty Opener. The 00HD option features 15" (38cm) 4mm-thick disk blades, a planter blade separator, and seed tube to accurately place seed. A 30% stronger spring provides up to 245 lbs (111.1kg) of penetration force to allow for operation in minimum till and light no-till conditions. An 18-position T-handle depth-controlled press wheel ensures accurate seeding depth and closing of the seed groove.

Features & Benefits

DISTRIBUTION TOWERS - Dimpled distribution towers and transition cone divide seed equally for excellent seed distribution across the entire drill.

HYDRAULIC WEIGHT TRANSFER - Transfers weight from the center frame to the wings, allowing even distribution of weight across the entire width of the implement.

ACTIVE HYDRAULIC DOWN PRESSURE - Simply dial in the desired down pressure and the active hydraulics will constantly maintain that pressure throughout the entire opener range of motion, keeping the opener in uniform contact with the soil in uneven conditions.

WHEEL TRACK REMOVAL - CTA implement models have an extra opener mounting position to lower the openers that are directly behind tractor tire tracks, ensuring proper seed placement and depth control.
