

# Precision Bucket

## ALLOWS PIN POINT ACCURACY

Precision Buckets are designed for greater control of the emptying of material from the bucket. The long bottom part of the bucket creates friction that slows the emptying and that gives the operator much more precision. There are two versions offered; straight bucket with parallel side gables and a conical bucket that has a narrower front for even greater precision. Both version benefit from AÖ's notorious conical bucket back for a clean and complete emptying of material. The front loader version with Euro or SMS hooks has a depth of 2 meters because of limitations in the loading capacity. A wheel loader version is available with Big BM hooks with a depth of 2.5 meters and has much higher capacity to maximise the capability of larger wheel loaders.
